

Memo: A Faster Way to Spot Under-Performing Sites

To: Senior Manager, Operations | From: [Your Name] | Re: Automated Efficiency Tracking Tool

What I Built

I put together a simple tool that looks at how much each site actually produced today compared to what it was expected to produce, turns that into a single efficiency score, and then labels each site **Normal**, **Warning**, or **Critical** based on that score. Right now it's set up for three fuel depots, but it works the same way for any number of sites — wards, stores, warehouses, whatever we point it at.

Why We Need This

Today, spotting an under-performing site usually means someone manually pulling numbers from a spreadsheet or waiting for a phone call after something has already gone wrong. That works, but it's slow and it depends on someone remembering to check. As we add more sites, manual review doesn't scale — the more locations we're responsible for, the easier it is for a struggling one to slip through unnoticed for a day or two.

How This Helps Us Move Faster

This tool runs the same check, the same way, on every site, instantly, instead of relying on someone to manually compare numbers site by site. Because every site gets scored using the exact same rule, there's no guesswork or inconsistency between how one person reviews the numbers versus another. The output is a short, plain report that immediately tells you which sites need attention today, so instead of scanning raw numbers for anomalies, a manager can go straight to the sites flagged 'Critical' or 'Warning' first.

Recommended Next Step

I'd recommend piloting this as a short automated report that runs at the start of each shift for your department's sites, so the first thing a manager sees each morning is a ranked list of which locations are running fine and which ones need a call today. Once we've validated the thresholds against a few weeks of real results, this same report could be scheduled to run and land in your inbox automatically, with no manual pulling of numbers required.

Happy to walk through this live and adapt the thresholds to whatever standard your department already uses.
